

3. Solution Requirements

Functional and non-functional requirements for the proposed ServiceNow solution

Project Title	Auto Ticket Classification using Flow Designer	Team ID	MKU201AutoTicket
Date	30.09.2026	Platform	ServiceNow Flow Designer / Workflow Studio

Problem Statement

Manual ticket classification and routing can lead to inconsistent categorisation, delayed assignment and avoidable rework. The proposed solution uses ServiceNow Flow Designer to evaluate incoming Service Catalog requests, classify them using configurable rules, route them to the appropriate team and create a fulfilment task with traceable status.

Functional Requirements

ID	Requirement	Priority
FR-01	Capture Service Catalog request details and requester information.	High
FR-02	Start the flow automatically when the defined Service Catalog trigger occurs.	High
FR-03	Evaluate request data using configurable classification conditions/rules.	High
FR-04	Determine the appropriate category or assignment group from the classification result.	High
FR-05	Create a Catalog Task (SCTASK) linked to the Requested Item (RITM).	High
FR-06	Populate task description and relevant context from the request.	High
FR-07	Maintain task state, work notes and activity history for traceability.	Medium
FR-08	Provide a controlled error-handling path for failed flow actions.	Medium
FR-09	Allow administrators to test, publish, activate and maintain the flow.	Medium

Non-Functional Requirements

Area	Requirement
Reliability	The flow should execute consistently and provide an error path when an action fails.
Maintainability	Classification conditions and routing rules should be easy for ServiceNow administrators to update.
Performance	Automation should reduce manual classification and assignment steps without unnecessary flow actions.
Security	Only authorised users/roles should create, modify or administer flows and classification rules.
Auditability	Request, RITM and SCTASK relationships and activity history should remain traceable.
Usability	The resulting task should contain clear descriptions and assignment information for the fulfilment team.

Acceptance Criteria

- A valid Service Catalog request starts the flow automatically.
- The flow applies the configured classification logic and records the resulting routing decision.
- A linked Catalog Task is created for the selected assignment group.
- The task contains the request context and can be tracked through its lifecycle.
- A test case with invalid or incomplete data follows the defined error/exception path.
