

4. Technology Stack

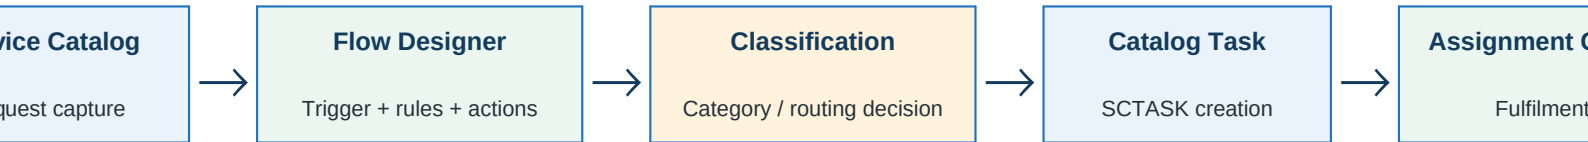

Technology components used or proposed for the Auto Ticket Classification solution

Project Title	Auto Ticket Classification using Flow Designer	Team ID	MKU201AutoTicket
Date	30.09.2026	Platform	ServiceNow Flow Designer / Workflow Studio

Architecture Stack

Layer	Technology / Component	Purpose
User interface	ServiceNow Service Catalog	Collects request information from the requester.
Workflow automation	ServiceNow Flow Designer	Triggers the automation, evaluates conditions and orchestrates actions.
Workflow authoring	Workflow Studio	Provides the visual flow-building and administration experience.
Classification logic	Flow conditions / Decision logic	Maps request attributes to a ticket category or routing outcome.
Task management	ServiceNow Catalog Task (SCTASK)	Creates and tracks fulfilment work for the responsible team.
Request records	REQ / RITM	Maintains parent request and requested-item context.
Assignment	ServiceNow assignment groups	Routes generated tasks to the appropriate fulfilment team.
Audit & monitoring	Activity / flow execution history	Provides traceability of status changes and automation activity.

Technology Flow

Prototype evidence mapped to the stack

The supplied screenshots show the Workflow Studio flow “Standard laptop tasks,” a Service Catalog trigger, a “Create Catalog Task” action, a generated RITM and SCTASK, and a Hardware assignment group. In the final project, the same orchestration pattern is used as the foundation for automatic classification and routing.

Recommended implementation note

Keep classification rules configurable rather than hard-coded. This makes it possible to add new ticket categories, assignment groups and conditions without redesigning the entire flow.
