

Solution objective

Automate the standard laptop procurement request from Service Catalog submission through approval and catalog-task creation, so the IT team can process the request consistently and track its status.

Functional requirements

ID	Requirement	Acceptance check
FR-01	Provide a Standard Laptop request through Service Catalog.	A request can be submitted and a requested item is created.
FR-02	Capture requester, item, quantity and order details.	Request record displays the captured information.
FR-03	Route the request for approval.	Approval status is available on the flow/records.
FR-04	Automatically create a Catalog Task after the request flow reaches the task step.	A catalog task is generated and linked to the requested item.
FR-05	Assign the task to the Hardware group / responsible team.	Catalog task shows the appropriate assignment group.
FR-06	Maintain task state and laptop configuration description.	Task contains short description and state fields.
FR-07	Allow IT staff to review request, requested item and task records.	Related records can be opened and tracked.

Non-functional requirements

Area	Requirement
Usability	Request and task information should be clear and easy for employees and IT staff to understand.
Reliability	The automation should consistently create the required catalog task when the request flow runs successfully.
Traceability	Request, requested item and catalog task should remain linked for tracking.
Security	Only authorized users should approve, administer or update procurement records.
Maintainability	Flow actions, task descriptions and assignment rules should be easy for administrators to update.
