

PERFORMANCE TESTING

Project: Streamlining IT Procurement Automation – Standard Laptop
Team ID: MKU201 Laptop orders
Date: 30.09.2026
Platform: ServiceNow Workflow Studio / Service Catalog

1. Objective

The objective of performance testing is to verify that the Standard Laptop procurement automation responds correctly and completes its workflow steps efficiently under normal usage. The test focuses on request creation, flow triggering, catalog-task creation, and record availability across the Request, Requested Item, and Catalog Task stages.

2. Performance Test Scope

Test Area	What is Tested	Expected Result
Service Catalog submission	Creation of a Standard Laptop request	Request is created without unnecessary delay
Flow trigger	Service Catalog trigger starts the automation	Flow starts automatically
Catalog task creation	Create Catalog Task action	One task is generated for the requested item
Record propagation	Request → RITM → Catalog Task	Related records are available and linked
Task processing	Hardware assignment/task details	Task contains the required procurement/configuration details
Repeated requests	Multiple requests submitted separately	Each request is processed independently

3. Test Cases

ID	Test Case	Steps	Expected Outcome
PT-01	Single laptop request	Submit one Standard Laptop request from the Service Catalog.	Request and Requested Item are created.
PT-02	Automatic flow execution	Verify the Standard laptop tasks flow after submission.	Service Catalog trigger invokes the flow.
PT-03	Catalog task generation	Check the Requested Item related Catalog Tasks.	Catalog Task is created with the expected short description.
PT-04	Record linkage	Open Request, RITM and Catalog Task records.	Records remain linked through the procurement process.
PT-05	Concurrent/Repeated requests	Submit several requests one after another.	Each request receives its own processing path without interference.
PT-06	Task completion readiness	Open the generated Catalog Task and review state/approvals.	Task is ready for the Hardware team to process.

4. Performance Metrics

Metric	Measurement / Acceptance Criteria
Request creation time	Record the time from submission until the Request and Requested Item are available.
Flow start time	Record the time between request creation and flow execution.
Catalog task creation time	Record the time between RITM creation and Catalog Task creation.
End-to-end processing time	Measure from Service Catalog submission to creation of the required Catalog Task.
Success rate	Target: 100% of valid test requests create the expected records.
Error rate	Target: 0 workflow errors for valid test data.

5. Evidence from Implemented Solution

The supplied ServiceNow screenshots show the implemented Standard laptop tasks flow with a Service Catalog trigger and a Create Catalog Task action. The screenshots also show a Request (REQ0010001), Requested Item (RITM0010001), and Catalog Task (SCTASK0010001), demonstrating that the automation produced the expected linked records. The Catalog Task shows an Approved approval value, Open state, Hardware assignment group, and the short description "Laptop need to Configured". These are functional evidence points; exact response-time measurements were not provided in the screenshots and should be captured during execution of the performance test cases.

6. Test Result Summary

Category	Status	Remarks
Workflow execution	PASS – functional evidence	Flow is active/published and contains the Service Catalog trigger and Create Catalog
Record creation	PASS – functional evidence	Request, RITM and Catalog Task records are visible in the supplied screenshots.
Record linkage	PASS – functional evidence	Catalog Task references RITM0010001.
Response-time measurement	TO BE MEASURED	No measured timings are visible in the supplied evidence.
Load/concurrency testing	TO BE MEASURED	Requires execution with multiple requests/users.

7. Conclusion

The Standard Laptop procurement automation has a clear workflow path from Service Catalog request to Catalog Task creation. Functional evidence supplied for the project supports the workflow behavior. Formal performance figures such as average response time, throughput, and concurrent-user capacity should be recorded using the test cases and metrics above before final performance sign-off.
