

Code Layout, Readability and Reusability

Streamlining IT Procurement Automation – Standard Laptop

Assessment of the ServiceNow workflow implementation

Team ID	MKU201 Laptop order
Date	30.09.2026
Platform	ServiceNow – Service Catalog and Workflow Studio
Automation	Standard laptop request → Requested Item → Catalog Task

1. Implementation Approach

This project is implemented primarily as a **ServiceNow low-code workflow** rather than a standalone programming-language application. Therefore, code quality is evaluated through flow layout, naming, logical separation, data-pill usage, configuration consistency, and reusability.

The supplied flow named **Standard laptop tasks** has a clear two-part structure: a Service Catalog trigger followed by a Create Catalog Task action. This keeps the automation easy to follow and reduces unnecessary branching.

2. Code / Flow Layout

Area	Implementation in this project	Readability / reuse practice
Flow name	Standard laptop tasks	Descriptive name communicates the business purpose immediately.
Trigger	Service Catalog	Single, visible entry point for the laptop request process.
Main action	Create Catalog Task	Action directly represents the required fulfilment operation.
Data mapping	Requested Item Record and flow data	Use standard ServiceNow data pills/record references instead of duplicated values.
Task content	Laptop need to Configured	Standard wording can be reused for the same request type.
Assignment	Hardware assignment group shown in evidence	Keep routing rules standardized so similar laptop requests follow the same path.

3. Readability Standards

- Use business-oriented names for flows and actions.
- Keep the normal path visually linear: trigger → action → fulfilment.
- Avoid unnecessary branches when the requirement is a single task creation step.

- Use ServiceNow record references/data pills so values come from the request context.
- Keep task descriptions consistent for standard laptop fulfilment.
- Document any future conditions or additional actions before adding them to the flow.

4. Reusability

Reusable component	How it can be reused
Standard laptop flow pattern	The same trigger → task pattern can support other standardized IT catalog items with appropriate task details.
Task description convention	A common description format can be applied to similar hardware fulfilment tasks.
Assignment convention	A consistent assignment-group rule can route hardware-related tasks to the responsible team.
Request record reference	The generated task can retain a reference to the originating Requested Item for traceability.

5. Quality Assessment

The current implementation is compact and understandable because the demonstrated business logic is simple. Future expansion should preserve the same structure by adding clearly named actions or subflows only when a new requirement is introduced. This avoids turning a standard laptop workflow into an unnecessarily complex flow.

Evidence from the ServiceNow implementation

The supplied screenshots are used as implementation evidence. They show the Service Catalog trigger, the Standard laptop tasks flow, the Requested Item, the generated Catalog Task, and its fulfilment fields.

Figure 1. Workflow Studio flow: Service Catalog trigger and Create Catalog Task action.

Figure 4. Catalog Task showing approval, priority, state, request item, and laptop configuration description.
