

Streamlining IT Procurement: Automating Standard Laptop Orders

1. Communication

Date: 30.09.2026

Team ID: MKU201 Laptop Orders

This document defines how the team will communicate the project purpose, workflow, progress, demonstration results, and final outcome for the Standard Laptop procurement automation developed in ServiceNow.

Project Communication Objective

Communicate the end-to-end automation clearly to reviewers, mentors, and team members. The communication focuses on the business problem, the ServiceNow Flow Designer solution, the approval-driven task creation, and the final Hardware assignment.

Key Message

The project streamlines standard laptop procurement by using ServiceNow Service Catalog and Flow Designer. After a Standard Laptop request is approved, the flow automatically creates a Catalog Task with the required description and assigns it to the Hardware group.

What Will Be Communicated

- Project title, date, and team identification.
- Service Catalog request and approval process.
- Flow Designer trigger and Create Catalog Task action.
- Requested Item and Catalog Task relationship.
- Automatic assignment of the task to the Hardware group.
- Demonstration evidence and final project repository/video links.

Communication Channels

- Project demonstration session for the final walkthrough.
- GitHub repository for project documentation, phase-wise work, and screenshots.
- Demo video for showing the completed workflow.
- Team discussion and mentor/reviewer communication for feedback and approval.

Communication Approach

The team will use a simple sequence: problem → proposed automation → ServiceNow configuration → live request → approval → automatically generated Catalog Task → final verification. This keeps the explanation easy to follow and connects each demonstration step to the project objective.

Expected Communication Outcome

Reviewers should be able to understand what was automated, how the flow works, what evidence confirms successful execution, and how the solution can be extended in future.

Supporting Evidence
